

\$env/dynamic/private

This module provides access to runtime environment variables, as defined by the platform you're running on. For example if you're using `adapter-node` (or running `vite preview`), this is equivalent to `process.env`. This module only includes variables that *do not* begin with `config.kit.env.publicPrefix` *and do* start with `config.kit.env.privatePrefix` (if configured).

This module cannot be imported into client-side code.

Dynamic environment variables cannot be used during prerendering.

```
import { env } from '$env/dynamic/private';
console.log(env.DEPLOYMENT_SPECIFIC_VARIABLE);
```

“ In `dev`, `$env/dynamic` always includes environment variables from `.env`. In `prod`, this behavior will depend on your adapter.
