

SVELTE • STYLING

Nested `<style>` elements

There can only be one top-level `<style>` tag per component.

However, it is possible to have a `<style>` tag nested inside other elements or logic blocks.

In that case, the `<style>` tag will be inserted as-is into the DOM; no scoping or processing will be done on the `<style>` tag.

```
<div>
  <style>
    /* this style tag will be inserted as-is */
    div {
      /* this will apply to all `<div>` elements in the DOM */
      color: red;
    }
  </style>
</div>
```
