

{@render ...}

ON THIS PAGE

To render a snippet, use a `{@render ...}` tag.

```
{#snippet sum(a, b)}  
  <p>{a} + {b} = {a + b}</p>  
{/snippet}  
  
{@render sum(1, 2)}  
{@render sum(3, 4)}  
{@render sum(5, 6)}
```

The expression can be an identifier like `sum`, or an arbitrary JavaScript expression:

```
{@render (cool ? coolSnippet : lameSnippet)() }
```

Optional snippets

If the snippet is potentially undefined — for example, because it's an incoming prop — then you can use optional chaining to only render it when it *is* defined:

```
{@render children?.() }
```

Alternatively, use an `{#if ...}` block with an `:else` clause to render fallback content:

```
{#if children}
```
