

SVELTE • RUNES

\$host

When compiling a component as a custom element, the `$host` rune provides access to the host element, allowing you to (for example) dispatch custom events ([demo](#)):

Stepper.svelte

```
<svelte:options customElement="my-stepper" />

<script>
  function dispatch(type) {
    $host().dispatchEvent(new CustomEvent(type));
  }
</script>

<button onclick={() => dispatch('decrement')}>decrement</button>
<button onclick={() => dispatch('increment')}>increment</button>
```

App.svelte

```
<script>
  import './Stepper.svelte';

  let count = $state(0);
</script>

<my-stepper
  ondecrement={() => count -= 1}
  onincrement={() => count += 1}
></my-stepper>

<p>count: {count}</p>
```
