

style:

The `style:` directive provides a shorthand for setting multiple styles on an element.

```
<!-- These are equivalent -->  
<div style:color="red">...</div>  
<div style="color: red;">...</div>
```

The value can contain arbitrary expressions:

```
<div style:color={myColor}>...</div>
```

The shorthand form is allowed:

```
<div style:color>...</div>
```

Multiple styles can be set on a single element:

```
<div style:color style:width="12rem" style:background-color={darkMode ? 'black' : 'wh
```

To mark a style as important, use the `|important` modifier:

```
<div style:color|important="red">...</div>
```

When `style:` directives are combined with `style` attributes, the directives will take precedence:

PREVIOUS

[class:](#)

NEXT

[Scoped styles](#)
