

svelte/server

ON THIS PAGE

```
import { render } from 'svelte/server';
```

render

Only available on the server and when compiling with the `server` option. Takes a component and returns an object with `body` and `head` properties on it, which you can use to populate the HTML when server-rendering your app.

```
function render<
  Comp extends SvelteComponent<any> | Component<any>,
  Props extends ComponentProps<Comp> = ComponentProps<Comp>
>(
  ...args: {} extends Props
    ? [
      component: Comp extends SvelteComponent<any>
        ? ComponentType<Comp>
        : Comp,
      options?: {
        props?: Omit<Props, '$$slots' | '$$events'>;
        context?: Map<any, any>;
      }
    ]
    : [
      component: Comp extends SvelteComponent<any>
        ? ComponentType<Comp>
        : Comp,
      options: {
        props: Omit<Props, '$$slots' | '$$events'>;
```
