

SVELTE • LEGACY APIS

\$\$slots

In runes mode, we know which snippets were provided to a component, as they're just normal props.

In legacy mode, the way to know if content was provided for a given slot is with the `$$slots` object, whose keys are the names of the slots passed into the component by the parent.

Card.svelte

```
<div>
  <slot name="title" />
  {#if $$slots.description}
    <!-- This <hr> and slot will render only if `slot="description"` is provided. -->
    <hr />
    <slot name="description" />
  {/if}
</div>
```

App.svelte

```
<Card>
  <h1 slot="title">Blog Post Title</h1>
  <!-- No slot named "description" was provided so the optional slot will not be rendered -->
</Card>
```
