SVELTEKIT • REFERENCE

$env/static/private

Environment variables <u>loaded by Vite</u> from `.env` files and `process.env`. Like `$env/dynamic/private`, this module cannot be imported into client-side code. This module only includes variables that *do not* begin with `config.kit.env.publicPrefix` *and do* start with `config.kit.env.privatePrefix` (if configured).

Unlike `$env/dynamic/private`, the values exported from this module are statically injected into your bundle at build time, enabling optimisations like dead code elimination.

```
import { API_KEY } from '$env/static/private';
```

Note that all environment variables referenced in your code should be declared (for example in an `.env` file), even if they don't have a value until the app is deployed:

```
MY_FEATURE_FLAG=""
```

You can override `.env` values from the command line like so:

```
MY_FEATURE_FLAG="enabled" npm run dev
```
