SVELTEKIT • REFERENCE

$env/dynamic/public

Similar to `$env/dynamic/private`, but only includes variables that begin with `config.kit.env.publicPrefix` (which defaults to `PUBLIC_`), and can therefore safely be exposed to client-side code.

Note that public dynamic environment variables must all be sent from the server to the client, causing larger network requests — when possible, use `$env/static/public` instead.

Dynamic environment variables cannot be used during prerendering.

```
import { env } from '$env/dynamic/public';
console.log(env.PUBLIC_DEPLOYMENT_SPECIFIC_VARIABLE);
```
